Proactive Endpoint Protection with Morphisec Guard

For too long, cybersecurity vendors have focused on detecting and responding to threats that bypass traditional antivirus. These detection-centric tools have proven to be ineffective despite their high cost and skill requirements to operate. Morphisec Guard is a more effective and lower cost alternative that works immediately and automatically.

Morphisec Guard works on top of the security controls that are built into Windows 10 by adding patented moving target defense technology to your endpoint security stack. This prevents the threats that are designed to bypass status quo prevention and detection mechanisms. Furthermore, Morphisec Guard adds visibility, control, and anti-tampering to Windows’s native security controls including antivirus, drive encryption, firewall, and device control.

Improve your endpoint security and simplify your operations with the lowest possible TCO.

Morphisec Guard Protects the Entire Organization

Against the Full Attack Chain...

Earliest Stage, Proactive Endpoint Protection

Morphisec Guard extends your prevention capabilities beyond that of any other antivirus through Moving Target Defense by creating a zero-trust execution environment. By morphing memory resources only trusted code can run so advanced threats are prevented even when there is no known signature or behavioral pattern. Additionally, rich forensic information is captured for teams who need it.
Morphisec delivers an entirely new level of innovation with its Moving Target Defense-powered proactive endpoint protection platform to create a zero-trust execution environment for your applications. This proactively creates a prevent-first posture against the most advanced threats to the enterprise, including APTs, file-based malware, zero days, ransomware, evasive fileless attacks and web-borne exploits. This complete endpoint security solution easily deploys into a company’s existing security infrastructure to form a simple, highly effective, cost-efficient technology stack that is truly disruptive to today’s existing cybersecurity model.

**How It Works**
Morphisec creates a zero-trust execution environment by morphing the application memory. This changes the memory structure of your applications so only trusted code is allowed to execute. By doing this, Morphisec prevents zero days, fileless attacks, in-memory exploits, and evasive malware.

Additionally, Morphisec Guard takes control of native Windows’ antivirus (Defender), drive encryption (BitLocker), personal firewall, and device control. By adding visibility, control, and anti-tampering to native OS security, you don’t have to pay for what you already have. Achieve better protection while reducing costs.

**Secure Everything**
Morphisec Guard secures your physical, and virtual endpoints, including VMware Horizon View and Citrix.
